Review for usability and accessibility

This website design has so far met the standard requirements mentioned in the lectures and assignment description. The feature details will be shown in the feature plan.

The website is able to perform the basic usability in the milestone stage according to the code testing by each group members. Some advanced features have not yet been implemented. They will be added into the code in the further coding process as we learn more about implementing web applications throughout this course.

The basic design of this website has been peer reviewed and the feedbacks are shown below:

- The homepage shows some restaurants recommendations and the rating of the restaurant based on the customer's feedback.

- On the sign up page, user's personal address is unnecessarily needed.

- For the restaurateurs register page, no more information need to be added .

- Additional information should be added to the manage profile page. For example, the restaurateur phone and the address.

- The manage booking detail page. It's excellent to use progress bar to demonstrate the user booking time periods. It is convenient for restaurants to check and manage the booking information.

- The User search page and the restaurant information & reservation page are included in the site design.

- Brief and clear page layouts. Pictures with detailed content can be attractive to the web browsers!

- The Booking completed page is included in the site design.

- The 'successful booking notice' should return the booking number. If you can show where the restaurant on the map, that will be awesome!

Record any updates to your design made as a result of the above testing and review.

- Removed the user's personal address from the sign up page. This change will be updated in Design 2.0.

- The appearance of login page has been improved to be concise and clear.

- Restaurateur's contact number and the address will be added to the manage profile page.

- Added "Finish edit" button to Manage Profile Page to allow restaurateur confirming information editing.

- Added "See Booking Details" button to Manage Profile Page to allow accessing the Manage Booking Detail diagram Page.

- Added "back" button to the Manage Booking Detail , located underneath the diagram to lead to the previous page.

- Refined the Reservation Bar in the Restaurant Information & Reservation Page: added party-size component within a dropdown listbox; add "book" button to click for confirming the reservation.

- Added "Got it" button for users to click after arriving and confirming the reservation with the restaurant.

- Might add feedback survey if had a rating system in in the further coding process.
